

## Klik IT announces new Manage-it! Release

10<sup>th</sup> September 2020

Manage-it! Version 1.03 is available for general release.

This latest release includes a new analytics dashboard, the Job Performance Analyzer. It provides high level technical information in a collated and summarized form. Taken from the JD Edwards Job History tables, the data can be filtered by time period and sorted according to details required. This is available to JD Edwards users from **within** the JD Edwards system and does not require involvement from system or database administrators.

Users can find out:

- the longest running batch jobs
- how often they are run and who is submitting them
- the combined run times (for the jobs) on their system
- performance differences between varying versions of the same jobs
- historical trends of run times for jobs to complete - some that used to run quickly may be taking longer

“Manage-it! is a great product that lets users gain a much clearer understanding of what is impacting the health and performance of their JD Edwards system – and you don’t need to be a system administrator to use it or understand it.”

“We designed Manage-it! to grow, based on customer feedback and evolving business practices, and that’s exactly what we’re delivering with Version 1.03. We’re committed to continuing with this development work moving forwards.”

Terry Clarke, CEO Klik IT
